

Rt.Hon. Rishi Sunak MP
Prime Minister
10 Downing Street
London
SW1A 2AA

Dear Prime Minister,

Preventing cardiovascular disease by reducing population salt intake

We are writing to urge you to prioritise reducing population salt intake as a key measure to prevent cardiovascular disease within your Major Conditions Strategy. Salt reduction is a simple, cost-effective and hugely impactful initiative that the UK knows how to do well, and with stricter measures will boost the UK workforce and economy.

As you have highlighted in the Major Conditions Strategy, CVD is one of the major causes of disability and death in the UK, responsible for one death every four minutes in England alone¹. During 2019/2020, there were around one million hospital admissions for CVD in England, leading to 5.5 million bed days². NHS England spends an estimated £7.4bn on CVD healthcare costs annually, and the wider economic impact of these diseases is estimated at £15.8bn which includes productivity losses³. People living in the most deprived areas of the country are four times more likely to die prematurely from CVD than those in the most affluent areas⁴. The link between salt and high blood pressure extends to children and in recent years, there has been a worrying increase in children with high blood pressure⁵

The food industries are responsible for our salt intake

Decades of evidence shows that salt increases blood pressure, which leads to thousands of unnecessary deaths from CVD. UK salt intake is 40% higher than the recommended limit and most of our salt intake comes from the food we buy, with ready-made processed and packaged foods (e.g. bread, ready meals, cakes, processed meat) contributing to 75% of our daily salt intake. This cannot be removed by the individual and research shows that much of this salt is unnecessary: within each category of food there are numerous products that contain less salt – in some cases more than 20 times less⁶. The food industries must be incentivised to take action.

UK salt reduction programme: initial success to stalled progress

In 2006, the Food Standards Agency set salt reduction targets across more than 80 categories of food for the food industry to work towards. This was a triumph: new research⁷ released today shows by 2014, population salt intake had fallen by 19%, accompanied by falls in average blood pressure and deaths from stroke and heart disease (more than 9,000 CVD deaths per year prevented, NICE calculated this led to cost savings of £1.5 billion per year⁸). The minimal costs of salt reduction are

borne by the food industry, and gradual and unobtrusive improvements to processed food do not lead to loss of sales, as taste buds adapt and the public continue to buy their usual food whilst benefiting from the nutritionally improved products.

However, this research also shows that a change in the governance of the salt targets with increasing interference and even active oversight from the food industry⁹ led to salt reduction progress stalling. This in turn led to an increase in salt intake between 2014 and 2018, accompanied by a plateau in the previous reduction in CVD deaths – a plateau that is estimated to cost the UK £54 billion by 2029¹⁰.

Resuscitating progress

Building on the UK's initial success, many countries are now implementing legislated salt targets - the logical next step in the global aim to reduce salt intake – with the UK now lagging behind. Evidence from South Africa¹¹ shows that in just five years, their legislated targets had led to a large fall in population salt intake, with the biggest falls occurring in the most deprived groups.

A comprehensive and mandatory salt reduction programme, including targets, financial incentives and/or penalties, will ensure that all companies commit to salt reduction in the UK too. In private discussions with the food industry, they would prefer mandatory measures as this gives them a level playing field and would mean they are not in competition with each other.

We can have both a thriving British food industry a healthy, economically productive and resilient population. We urge you to include stricter measures to lower population salt intake as part of your Major Conditions Strategy and implement world leading measures to protect health and the UK workforce, reduce disparities, and build a sustainable NHS. There is strong public support for this, with 85% of UK adults supporting the Government implementing mandatory measures to remove unnecessary salt from food¹².
